SIM RACING CLUB ENDURANCE

A HEARTBRAKING END OF THE DAY

Few races test the limits of drivers and teams like the legendary 24 Hours of Spa. For Ten10 team (Dino, Kip, Toasty, Motsky, and Ace), it was the ultimate challenge of endurance, focus, and teamwork - until drama struck in last hours.

Motsky, Kip

Puff puff's Ferrari 296 in the first hours of the race

The 24 Hours of Spa are always a challenge, but for Team Puff Puff, this year's edition was a masterclass in perseverance and teamwork. From sunset stints to sunrise surges, the team clawed their way up against all odds, only to have the race slip from their grasp in the final hour.

The race began with a bang - well, almost. Toasty and Dino kicked things off with a pair of commanding opening stints, showing pace, control, and confidence as daylight faded over Spa. Both kept the car clean through traffic and chaos, setting up the team for a solid run into the night. Dino, unfortunately, would become the first to "meet the wall," but his early pace laid the foundation for the fight to come. Motsky joined

the party just after sunset, taking over from Kip holding a respectable 25th place. Despite Dino's earlier scrape with the barrier, the car had been repaired and still felt good. "The setup felt fantastic", Motsky noted. Unfortunately Kip had suffered a pit limiter failure during his previous stint, earning the team a drive-through penalty. Motsky served it immediately, only to be hit by technical problems of his own. His wheel disconnected mid-corner at Eau Rouge, sending him helplessly into the tire wall. "I just lost steering completely. All I could do was hang on", he said. The car crawled back to the pits under black-and-orange flags. Two minutes of repairs later, he was back out, having lost precious positions. ►

The night that followed was long and grueling. Tire pressures proved tricky, with Motsky struggling to bring heat into his rubber, losing pace as a result. Kip shared similar issues, but both managed clean stints that kept the car in the game.

“He got in, delivered, and got out. Classic Toasty”

Then came a much-needed boost: Toasty joined for another surgical run, slicing through traffic and gaining two spots with calm precision. “He didn’t say much”, Motsky said. “Just got in, delivered, and got out. Classic Toasty”.

With the sun rising over the Ardennes, Dino, Ace, Kip and Toasty each took their turns in the car. The pace was solid, the vibes better, and the team began making up ground. Despite a few spins, the car was quick and the chemistry tighter than ever. “We were in a better position on track, but also mentally”, Kip said. At this point, Puff Puff had climbed back to 24th. Motsky rejoined the rotation just as the track temperature climbed, and with pressures finally dialed in, he found his rhythm. Lap after lap, he pushed, shaving seconds off his earlier runs. “It was night and day”, he said. “The car finally came to me”. After that, Ace kept the momentum going. Delivering a clean stint and

handling blue flags with mastery, he lifted the team into 23rd place in one of the most competitive fields the league has seen.

But endurance racing has a cruel sense of timing.

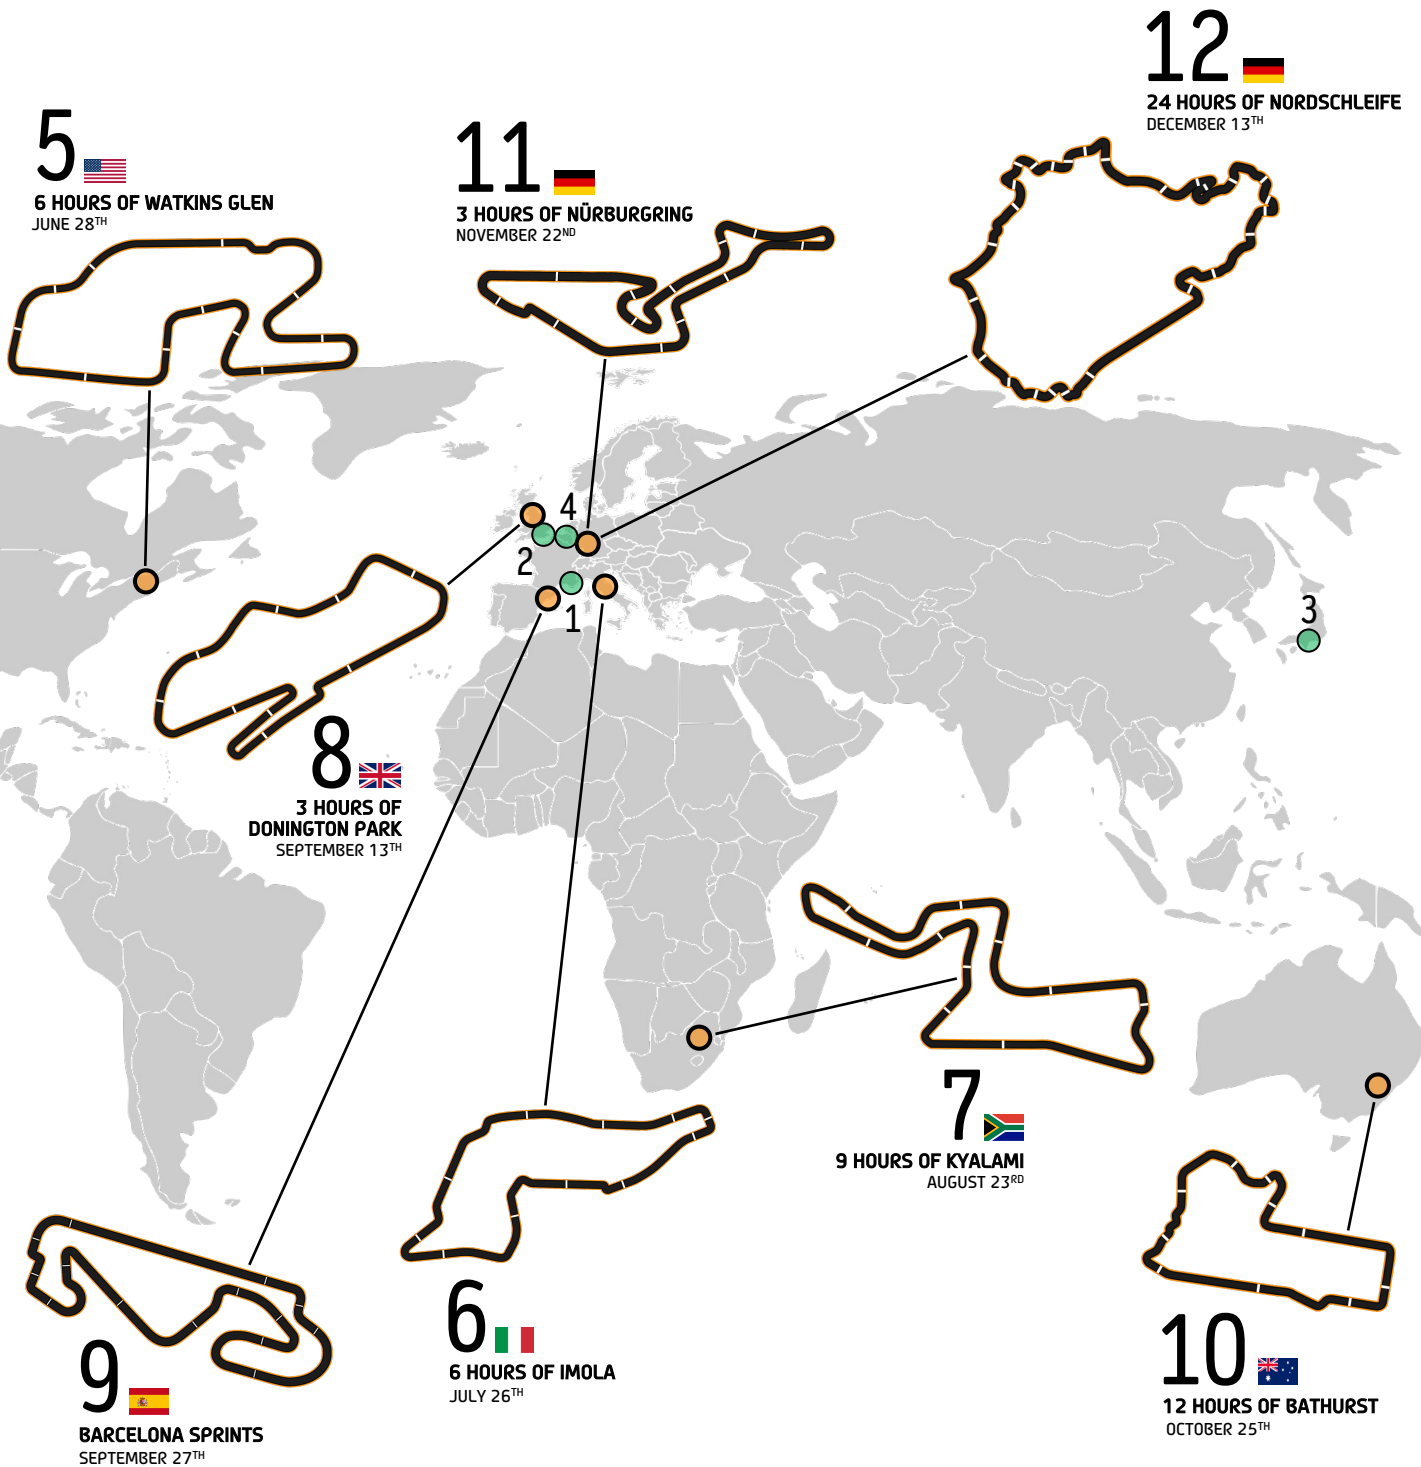

With less than two hours to go, a hardware issue hit Ace mid-stint, disconnecting him from the server without warning. Kip scrambled to get back in, but the car had reverted to default settings - damaged, unstable, and nearly undriveable. The team fought to stay in the race, but it was hopeless. At hour 23, after nearly a full day of resilience and teamwork, Team Puff Puff was forced to retire. “That sucks” Dino said. Kip remained positive: “I don’t feel bad at all about how we finished, we are learning endurance racing, and a 24-hour race is a hard task even for real life teams with dozens of staff and engineers and they also sometimes come home with a DNF. To drive 23 hours is a feat I’m immensely proud of all of us for achieving and I can’t wait for the next one to show them what we can do”.

And there’s no doubt they’ll be back. This wasn’t just a race - it was a display of perseverance. Even in defeat, Puff Puff stood tall. Meanwhile, whispers grow louder... an anonymous source hints their partnership with Ferrari could be on thin ice, with driver frustration over performance fueling talk of a potential split. Stay tuned ! ■

Puff puff’s Ferrari met the tire walls a few times throughout the race

WHAT'S NEXT IN SRC ?

TEN10 WRC CHAMPIONSHIP

ON THIN ICE

Round 2 took the drivers deep into the frozen forests of Norway. Treacherous conditions, fast stages, and relentless terrain pushed everyone to their limits. From early heartbreaks to heroic recoveries, this round had it all.

Motsky

Rally Norway's icy roads welcomed the championship's second round with a deceptive calm. The skies were clear, the sun low but present - a rare gift in a snow-covered landscape. Yet beneath that peaceful surface lay some of the most unforgiving stages of the season. Twisting through dense forests, the route offered little margin for error. Narrow, slick, and relentlessly technical, every corner demanded full commitment. One wrong call in the pace notes, one moment of hesitation, and your rally could be over before it truly began. It was a

rally where experience counted, but luck played its part too - and not everyone made it through unscathed.

A CLIO GRAVEYARD

For Team Holy Shift and their Clio lineup, Round 2 quickly turned into a nightmare. For Motsky, things went sideways early in SS2. "I thought it was flat out. Definitely wasn't", he admitted about a fast left-hander he had misjudged during recce. "I committed like it was flat... next thing I know, I'm off into a snowbank doing several barrel rolls". ►

The crash left his Clio battered with a rear-left puncture. “At that point, I just told myself that if a plane can fly with one engine out, I don’t see why a car can’t drive on three tires”, he joked. Despite losing over a minute and limping to the first service, repairs were partial at best. From SS4 to SS6, he took it easy. “I wasn’t pushing too hard. The goal became just getting it to Service Area 2 in one piece”, he said. “There were a few moments... a couple of unintentional 360s, but I managed”. Somehow, he brought the car to the finish in 4th place - damaged but still fighting.

Silva, on the other hand, wasn’t as lucky. His rally was chaotic from start to early end, with multiple incidents and near-spectator collisions.

“Azazel’s skills are about as good as Trump’s business management”

“The first two rounds I felt exhilarated with my results” he joked. “Now ? I’m aiming to completely annihilate the competition... or myself”. With Azazel, his eternal rival, now leading the championship, the salt was real. “Azazel’s skills are about as good as Trump’s business

Picture taken by a brave spectator almost killed by Silva’s front bumper

management”, he quipped. “If I catch that punk in the paddock, hands will be thrown”. Despite the struggles, Holy Shift isn’t done yet. “Did I mention I’m 1/10 Kenyan ? My Kenyan comrades will push me on for a solid finish”, Silva joked. Motsky remained optimistic too, adding, “We’ve still got a shot at the Constructors’ title, but we need to step up our consistency”. They may have suffered in the snow, but fortunately for them there is none in Kenya.

REDEMPTION TIME

After an early exit at Monte Carlo, where Rider’s rally ended nose-first in a ditch, expectations were a little more cautious heading into Norway. But if Monte was a wipeout, Norway was a statement. ►

Motsky's Clio speed-dating the Norwegian trees after hitting a snowbank

Rider's Ford Puma
sliding with precision
on the icy roads

On the icy, narrow stages of Rally Norway, Rider kept things mostly clean... *mostly*. "Car felt good and had decent pace", he said. "The run went well with a few hiccups - like a 50-meter rollover". That "hiccup" came courtesy of a right-rear tap on a rock, which sent his car sliding upside down through the snow. "I slid on my roof for a decent 50 to 100 meters before the game reset me", he explained, picking up a 30-second penalty in the process. Later on, a 50-second repair hold at the second service area added even more time to the clock.

"Worked out well in the end"

But even with nearly a minute and a half lost to chaos, Rider pushed on. He secured 3rd overall and 2nd on the Power Stage, salvaging a stellar result from what could've easily been another disaster. "Worked out well in the end", he shrugged - downplaying a drive that showed serious grit. From Monte Carlo ditch-digger to Norway podium finisher, Rider's comeback was nothing short of impressive.

MISTER CONSISTENCY

With Rally Norway in the rearview, one thing is

Clear : Ppoole may not love the snow, but he knows how to survive it. After grabbing 5th place for the second rally in a row (following his top-five finish at Monte Carlo), the quietly consistent driver remains firmly in the fight for the championship.

"Well, for me personally, Norway is probably my least favorite location", he admitted post-rally. "I generally struggle in the snow, and Scandi is always trying to give a free puncture, so my main objective was to not die. Literally just keep between the snowbanks and pray !" And pray he did - successfully. While others barrel-rolled into snowdrifts or limped to the finish with battle-scarred cars, Ppoole's strategy paid off once again. No fireworks, no drama - just clean, composed driving.

His back-to-back fifth-place finishes might not scream domination, but in a season this unpredictable, consistency is everything. If Ppoole can maintain this rhythm, he's well positioned to strike should the frontrunners falter. He's not here to steal headlines - he's here to steal points. And as the championship heats up, don't be surprised if the man who just wanted to "not die" ends up very much alive in the title fight. ■

TEN10 MOONDAY NIGHT

M2 THE MOON

Moonday Night Racing is back. With rain, server meltdowns, and heart-stopping finishes, Season 2 is already delivering the goods. From digital drama in Indy to on-track thrills at the Nürburgring, it's safe to say : buckle up.

Stenzel, Motsky

With Moonday Night's Season 2 underway, drivers are being pushed to their limits and pushing their cars just as hard. The opening round at a rainy Indianapolis was shaping up to be a tense wet-weather affair, but the servers had other plans. A mid-race outage brought the race to a premature end, and organizers opted to postpone it to the end of the season, keeping the calendar intact.

Round 2 (*ed. note. now round 1*) at Nürburgring was also a slugfest. Racers geared up for another wet weekend as practice and qualifying took place on a soaked track. Visibility was low, grip was a rumor, and the mood in the paddock could best be described as "cautiously terrified". But as quickly as the rain arrived, it vanished. By Sunday, clear skies, warm sunshine, and a dry track had transformed the stage. These fast conditions led to some unforgettable racing in

the BMW M2 field. Rider, Stenzel and Toasty locked into a three-way battle that had fans on the edge of their seats. Trading positions all the way to the end, they crossed the line within a second of one another - Rider snatching the win by mere tenths.

Over in the Porsche 992 class, the action was no less dramatic. Dino and Verguld were locked in a relentless wheel-to-wheel duel from lights to flag. Neither gave an inch, but Dino found just enough to edge ahead. Meanwhile, Byron's drive was clinical from start to finish, and never truly challenged. It wasn't the flashiest win of the day, but it was the kind of performance that quietly demands respect... once you realize just how flawlessly it was executed.

Safe to say, rain or shine, server or no server, Moonday Night is back, and better than ever. ■

WITH TOASTY

LRC & TEN10 LEGEND

Hop in for a ride with Toasty - Ten10 and LRC veteran, setup wizard, and all-around racing encyclopedia. Today, he breaks down the essentials of aerodynamics: what sticks, what slips, and what wins.

Motsky

HEY TOASTY ! TO START OFF SIMPLY: WHAT ROLE DOES AERODYNAMICS PLAY IN RACING ?

Racing is all about the tires, first and foremost. What aero does is push the tires into the track, through the bodywork and then the suspension. It's the increased load on the tires that gives a high downforce car more grip.

WHEN YOU'RE WORKING ON YOUR CAR SETUP HOW DO YOU TYPICALLY APPROACH AERO TUNING ? WHAT'S YOUR STARTING POINT ?

I start with the slowest highspeed corner. If you're struggling to get through those, especially if it leads into a long straight, it's time to turn up the wing angle.

HOW DO YOU FIND THE RIGHT BALANCE BETWEEN TOP SPEED AND CORNERING GRIP ?

If your highspeed corners are turning into low-speed corners, the answer is more downforce. On the other side, if you're easily making it through the tightest highspeed corners without feeling the car is anywhere near the limit of grip, you probably have too much, meaning you're losing speed on straights.

DO YOU ADJUST YOUR AERO SETTINGS BASED ON THE TRACK YOU'RE RACING ON? CAN YOU GIVE AN EXAMPLE?

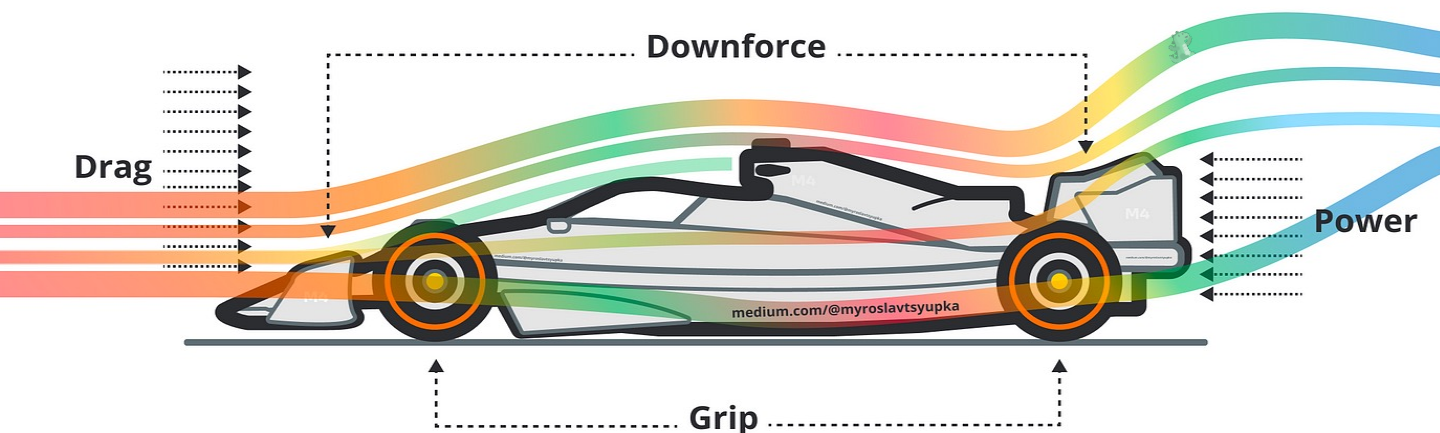

100%. The obvious examples would be your Monzas vs. Your Hungarorings. If a track is all straights, you want minimum wing angle, to the point where the aero is just there as part of regulation. If it's full of tight twisting sections, bring the biggest wings you have, because there's virtually no straight-line penalty of drag. But it's really the same concept. You're searching for the right balance of what the limit of grip is.

HOW SENSITIVE ARE THE CARS TO SMALL CHANGES IN AERO ? DO 1-2 CLICKS OF WING MATTER ? IS THE IMPACT NOTICEABLE ?

So, the faster a car goes, of course, the more downforce is generated. The cars with enough power to push past the drag that aero makes...those are the cars that are more sensitive to tiny adjustments. One click less rear wing will cause the rear axle to slide a little, for example. In a GT4? No, you need fairly large changes to notice anything substantial.

DO YOU EVER TUNE AERO WITH A FOCUS ON TIRE DEGRADATION MANAGEMENT ?

No. You can do much more with suspension and pressures to save tires than with aero. ►

THE RAKE EFFECT

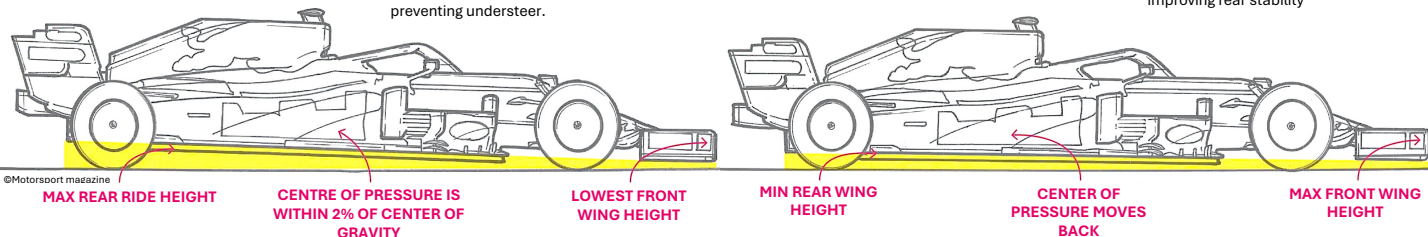

changes significantly with speed. The rake being the difference in height between front and rear

LOW SPEED

increases the rake due to the lack of downforce pressing on the rear suspension. The center of pressure moves forward as speeds fall, which improves cornering by preventing understeer.

HIGH SPEED

reduces the rake angle as the downforce from the rear wing builds and presses down on the rear suspensions. The center of pressure moves backwards, improving rear stability

HOW DO YOU HANDLE WET OR MIXED CONDITIONS IN TERMS OF AERO SETUP ?

If it's raining right at the formation lap, you're sure the track will be wet. There's no doubt. You need more downforce to help you get through the standing water. If it's a dry start, but there's rain coming, I'd go with a dry setup with a bit more aero, just to be safe. But it's always about the current conditions, same with tires. I've learned to not anticipate rain with a full wet setup.

DO YOU ACTIVELY TUNE RAKE TO INFLUENCE DOWNFORCE BALANCE IN YOUR SETUPS ?

Yeah, rake is an interesting one. In a detailed sim, it'll affect the airflow over the body of the car. Higher ride height in the rear, say 20 millimeters more than the front, will bring that rear wing up, so it'll be more exposed. It'll have less turbulent air, changing the aero balance. Of course, a big change in ride height is going to drastically change the handling of the car even without aero in mind... but you can use rake and downforce levels together to find an optimal balance for sure.

WHAT'S YOUR APPROACH WHEN IT COMES TO TESTING AERO CHANGES ? DO YOU RELY MORE ON LAP TIMES, TIRE DATA, OR JUST DRIVING FEEL ?

When testing out big changes at first, I'm comparing lap times. After that, when fine tuning, it's based on the car's balance. It's best to separate tuning concepts into low speed and highspeed corners, especially in a car with a lot of downforce potential. Your aero tuning will primarily influence the car's

Handling at high speed, so it's a way to balance the car in different areas of the track. If you're understeering, sometimes what you need is less angle in the rear wing to get it to rotate, instead of more at the front.

DOES THE TYPE OF CAR (GT, LMP, FORMULA) CHANGE HOW YOU THINK ABOUT AERO SETUP ?

Other than total levels of downforce overall, no. I mean, you always want to think about the full range of what's available to you. From there, the approach is exactly the same.

DO YOU ADJUST YOUR AERO SETUP IN MULTICLASS RACES TO BETTER HANDLE TRAFFIC AND DIRTY AIR ?

Not really, no. There's not much you can do with aero tuning to handle dirty air better. That's more of a car design and development thing. As the driver, you just have to deal with it and find some clean air to put yourself in, even if it's half the nose.

ANY TIPS FOR SIM RACERS WHO WANT TO BETTER UNDERSTAND HOW TO TUNE THEIR AERO SETUPS EFFECTIVELY ?

Get in a high downforce car in the sim, take it to a technical track, and take all the downforce off. Drive it like that until you can keep it on the track, then put all the downforce on. And don't just compare the lap times. Compare the top speed, and sector times if you can. Now do the same at a highspeed track full of straights. You'll quickly understand the impact of it all and the balancing act. Soon enough, it'll be another thing to add to your tuning toolbox. ■
